

ABSTRACT

The present invention provides a two compartment device (10), and method of use, for the disposal of used transdermal dosage forms (26) and the dispensing of unused transdermal dosage forms (28). The first compartment (12) has a dosage form inlet (16) and a detector (20), and the second compartment (14) has a dosage form outlet (22) in communication with the detector (20). The detector (20) permits the dispensing of an unused transdermal dosage (28) form from the outlet (22).
